

Bob **Watcher**

Bob forgets everything between sessions.

We fixed that.

T H E

Problem

Bob says:

"Use var for this variable."

Next session:

"Use var for this variable."

Next session:

"Use var for this variable."

Zero session memory

Bob starts from scratch every single chat. No memory of past corrections.

Repeated mistakes

The same errors fixed over and over. Developer time wasted daily.

New team members

Onboarding devs get the same wrong AI output senior devs corrected weeks ago.

Same mistakes.

THE SOLUTION

A Persistent Memory Layer for Bob

01

Capture

VS Code extension marks Bob's output. On save, logs before/after correction to `raw_log.json` automatically.

02

Learn

Rules engine calls IBM watsonx.ai Granite. Converts each correction into a plain-English rule in `registry.json`.

03

Compile

Briefing generator watches `registry.json`. Instantly compiles rules into `BOB_BRIEFING.md` when anything changes.

04

Brief

MCP server injects `BOB_BRIEFING.md` into Bob at every session start. Bob reads it and enforces all rules.

Works for any language · any codebase · any team

One correction. Permanent memory.

1

2

3

4

Developer corrects Bob

Selects Bob's wrong code
Ctrl+Shift+B to mark it
Makes the correction
Saves the file

Extension logs it

Before + After captured
Timestamp + filename
Written to raw_log.json
Automatically

watsonx.ai learns

Granite reads the diff
Generates a rule in plain English
Detects recurring mistakes
Escalates to high priority

Bob is briefed

BOB_BRIEFING.md updates
MCP server injects it
Bob reads rules on startup
Never repeats the mistake

Before vs After Bob Watcher

WITHOUT BOB WATCHER

- Bob repeats the same mistakes every session
- Developers manually re-explain standards daily
- New team members get wrong AI output
- Sprint scope ignored — Bob suggests out-of-scope features
- No learning from corrections ever made

VS

WITH BOB WATCHER

- Bob remembers every correction your team ever made
- Rules enforced automatically — zero developer effort
- New members onboard with full team history day one
- Sprint scope enforced — Bob never suggests out-of-scope
- Every session smarter than the last

Team collaboration

Shared rules registry across all team members

LIVE DEMO

Watch the pipeline work in real time

01

Developer marks Bob's wrong code

Ctrl+Shift+B → 'Marked as Bob output'

02

Makes correction and saves

raw_log.json updated automatically

03

Rules engine processes it

watsonx.ai: 'Always use const instead of var.'

04

Briefing updates in real time

BOB_BRIEFING.md reflects new rule instantly

05

New Bob session starts

'Briefing loaded. I will follow all team rules.'

06

Ask Bob to write the same code

Bob uses const. Rule enforced. Mistake gone.

Why this matters for every dev team

0x

Repeated mistakes
after first correction

∞

Sessions Bob
remembers rules

Day 1

New devs onboard
with full team history

Any Language

Rules are generated by AI — works for Python, Java, Go, Rust, or any language your team uses.

Any Codebase

Point it at any project. The pipeline adapts to whatever your team corrects.

Any Team Size

One developer or fifty. Every correction makes Bob smarter for the whole team.

Bob forgets. Bob Watcher doesn't.
